

Project Data Sheet

Project

Capital Dredging work at Hon Chong, Vietnam Dispute

Client

Dredging International NV

Project

This report was commissioned by Dredging International NV, who were the specialist sub-contractor for major capital dredging work to deepen the approach channel and turning area at Hon Chong, Vietnam. The execution of the work was adversely affected, apparently due to soils being encountered which were in part of a different character than was foreseen. Specifically, the soils were unexpectedly abrasive, causing excessive wear and tear to dredging plant and equipment.

ADBP provided an independent analysis of the various information provided to Dredging International in respect of the materials to be dredged and there from to assess whether, or not, the difficult ground conditions encountered could reasonably have been foreseen and quantified from the information provided. An assessment of the effect of ground conditions actually encountered on the plant and equipment which Dredging International employed on the works and an opinion as to whether, or not, Dredging International is entitled to additional payment was made.
