

Project Data Sheet

Project

River-Estuary channel improvements

Client

Milford Haven Port Authority, Wales, UK

Project

The recent arrival of large LNG tankers in Milford Haven required extensive alterations to the navigation aids in order to enable the safe navigation of the vessels into and out of the Haven.

ADBP were asked to provide a report on the available options and also to costs any proposed changes to the visual navigation aids. The study involved detailed design of the channel limits and turning area, investigation of possible land based sites, proposed new buoy positions, creation of new leading lines and lights.

The implementation of the recommendations is still ongoing as a phased approach was adopted by the Port Authority. The photograph above shows one of the new leading lights which was designed, contracted and construction supervised by ADBP.
