

## Project Data Sheet

**Project** Bathymetric & Side Scan Sonar Survey

**Client** South Hook LNG

**Project** A full bathymetric and side-scan sonar survey of was required to verify depths and to ensure no foreign objects remain within the berth as a result of the re-construction of the jetty. The report was to be delivered sufficiently in advance of the first vessel arriving to the jetty to enable corrective measures to be undertaken if significant objects were identified on the seabed.

ADBP was employed to prepare and manage the survey for the client. Tender documents were prepared and distributed to suitable contractors by ADBP before the award of the surveying contract. ADBP supervised the works to ensure effectiveness and accuracy. The received survey data was then processed by ADBP before a report was issued to the client, meeting all of the objectives set out at the commencement of the project.
