Gas Pipeline Landfall Marine Works

Client

Confidential

Project

ADBP was contracted by an international petrochemical company to provide a Client Representative for the Landfall Marine Works. The work, undertaken in an undeveloped and environmentally sensitive area of Europe, comprised of dredging a nearshore trench, laying the pulling wire and pulling ashore the pipeline from a lay barge, pressure testing the pipeline and backfilling the dredged trench with the dredged material.

To ensure the pull ashore could be undertaken in the early summer, preparatory work commenced in December 2008. Our Client's Representative, with a pipeline background, was one of a small team that issued the formal enquiries, interviewed selected tenderers and appointing a Contractor. A single team approach was developed during an intense scheduling and costing period to ensure that the required vessels and plant were secured in order to meet the programme. Project specific procedures with their associated risk assessments were also developed to ensure HSE complied with the Client's specific requirements.

On site the works were supervised to provide assurance that the required specifications and programmes were being met, and that there was no compromising of HSE standards.
